PROBLEM STRUCTURE

High operational costs in customer service call centre.

Hypothesis(operational)

- An operational factors that could lead to a high operating cost includes cost per call,shifts,team and volume performance.

Hypothesis(customer experience)

- The factors that are related to a customers include satisfaction score,escalations and resolution rates.

ROOT CAUSES

- The total cost of calls lodged by customers exceeding the monthly subscriptions of sevices that customers used,havingmore staffs in less busy shifts,lack of permanent solutions in problems that are reported and keeping several calls on hold rather than attending one call at a time.
- Low satisfaction score can lead a customer to move to another Telecom provider ,the waiting period for more technical knowledge and failure to resolve a problem in first attempt.

Key questions

- How much does the ConnectTel generate from customer monthly subscription vs Total cost of call per month?
- How many staff are allocated on a normal and busy shifts?
- How Team influence high operational cost?
- Is the satisfaction score high or low?
- Are there any escalation of problems to more technical?
- What is the resolution rate per agent?

PARTS OF THE DATA TO INVESTIGATE

- We will use the team,shift and agent columns to see where costs are higher.
- Cost per call and calls handled will help us understand the efficiency .FCR and escalation rate will help us to see if escalations are increasing then the combine data will help us understand what is causing operational costs.

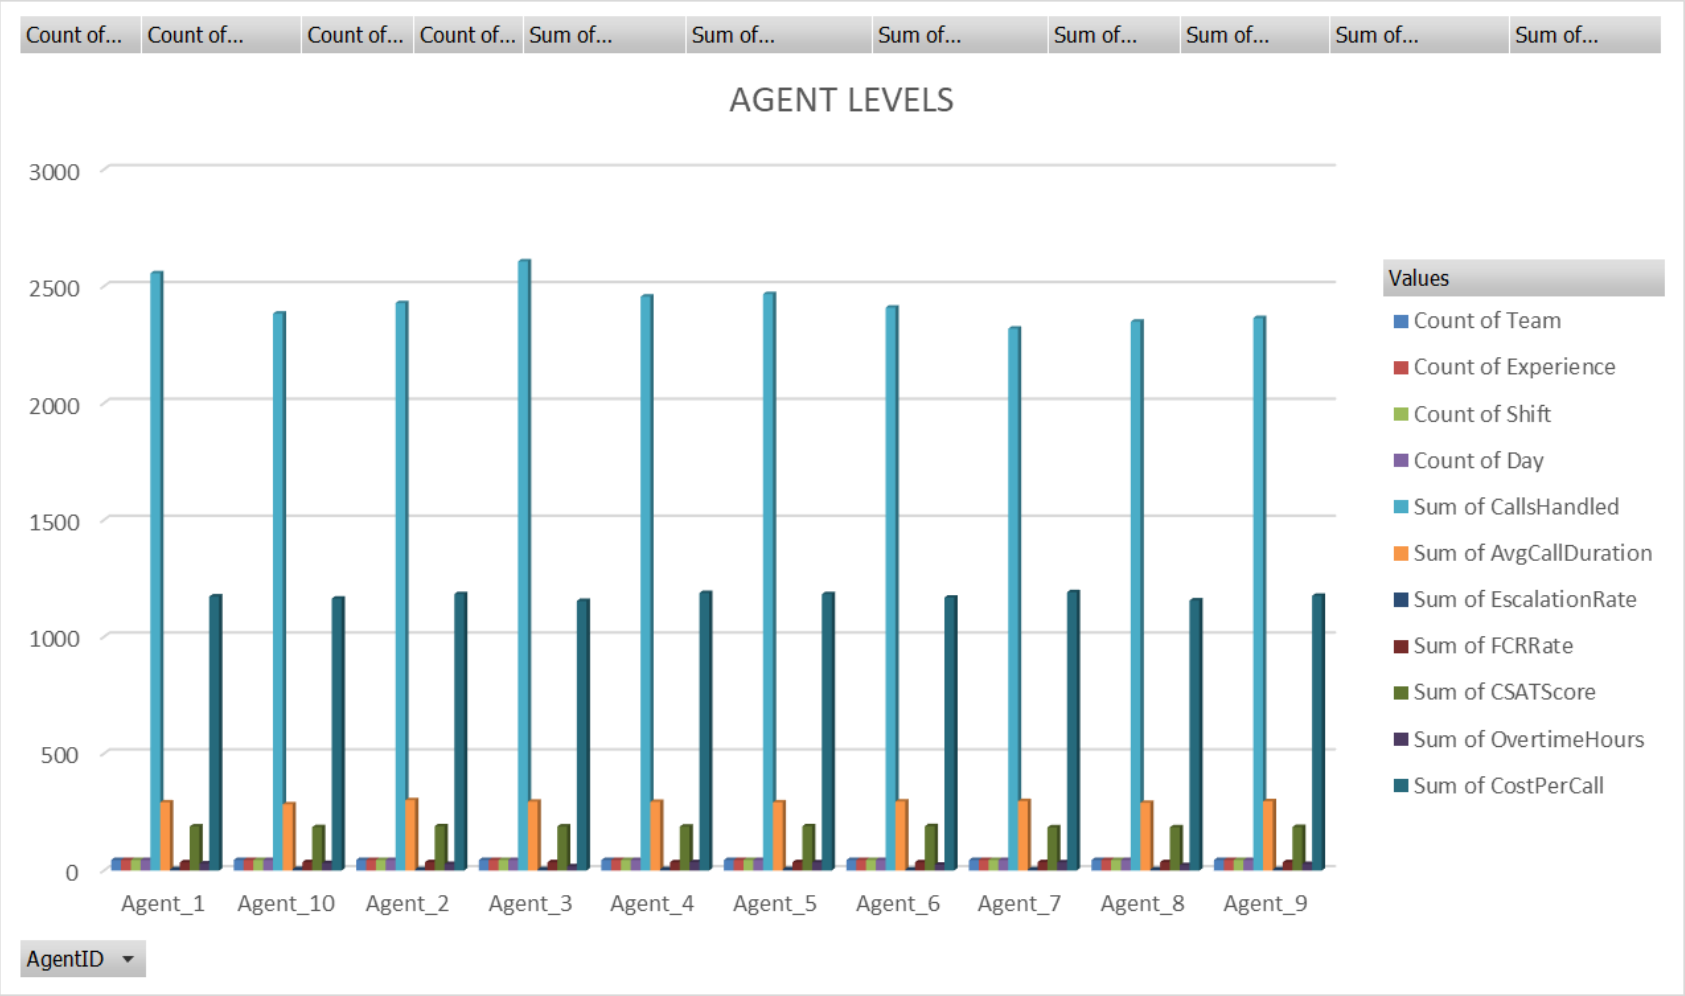
AGENT LEVELS



QUANTIFYING

- Team B appears less efficient with with longer calls,higher cost per call,more escalations and lower customer satisfaction.Team C perform best overall with a high call volume,shorter calls,lower cost and Higher customer satisfaction.
- The morning shifts handles the highest volume of calls which are 8,431 at the 25,95 which is the lowest cost and the evening shift is the most expensive per call handling 7,918 total volume of calls.
- Individual perfomances varies wildly regardless of a team because Agent 7 has a low CSAT score and the highest cost per call while top agents like Agent 3 handles significantly more volumes while keeping cost per call lower than bottom perfomers.

Summary

- The connectTel is spending too much money because Team B takes a long time on calls,overstaffing during the evening shift when there aren’t many customers calling and there are agentd who are increasing cost by failing to solve the problems on the first attempt which forces an expensive managers to step in .

IMPROVEMENTS

- I recommend that ConnectTel must move some staff from quiet evening to busy morning hours and give extra training to agents that are not perfoming well.

ASSUMPTIONS

- Changing of shifts from evening to a morning shift might upset the employees which could to quitting.
- Training takes times so the ConnectTel may not see the money being saved immediately
- Training underperforming agents simultaneously could lead to lack off attendance in customers quiries which upset the customers
